

THE META-TIME ARGUMENT

Why "Nothing" Cannot Create a Universe

Michael Richard Haimes

Modern cosmology often claims that time itself began at the Big Bang.

This creates a paradox because creation implies sequence, and sequence implies time.

True nothingness has no properties, no potential, and no laws.

From absolute nothing, nothing can arise.

Physics does not prove that there was nothing before the Big Bang.

It only shows the limits of our equations.

Meta-time is introduced as a deeper ordering principle.

Not clock time, but causal ordering without duration.

The Big Bang becomes a state transition, not an event in time.

If meta-time exists, then something eternal exists.

Reality is deeper than spacetime.

The universe did not arise from nothing.

Conclusion:

Either time never truly began, or something timeless caused it.

In neither case did reality arise from nothing.
